ABSTRACT

This publication presents numerous statistical tables that summarize 1974 data on state and local tax effort for the 50 states and the District of Columbia. The tax effort performance for each state is measured for the 14 most productive state tax sources, and the differences in performance are computed for each state. State personal income is used as the common denominator for comparing tax effort in most tax categories. The basic statistical data on which the calculations are based were supplied by the United States Bureau of the Census. Altogether 49 tables present comparative data on actual and potential tax revenues on a state-by-state and regional basis; to facilitate year-to-year comparison of data, most of the tables are identical in format to the tables in "State and Local Revenue Potential, 1973." FOREWORD

In this eighth consecutive annual report on State and Local Revenue Potential, the authors provide a ready reference to the latest changes in patterns of state finance. The basic method of analysis remains the same, thus providing for compatibility and continuity with previous reports.

Among the authors' conclusions is their statement that, "The tax burden of the SREB states continued to be the least in relation to total personal income and that of the Middle Atlantic states was the greatest. The three regions with the highest burden reduced taxes from 1973 to 1974, while the three regions with the lowest burden increased average taxes as a percent of personal income. Thus, taxes nationwide became more equal."

Regional convergence with the nation's characteristics has been noted by many observers of recent Southern history. While increasing similarities between regional and national characteristics are sometimes unnoticed, regional diversities as great as those of the nation are also sometimes neglected. A case in point is the spread in tax burden to which the authors refer. The South includes the state with the third highest burden in the nation as well as the one with the ninth lowest burden. Thus each state must cope with its own special fiscal and educational problems as well as those shared with the region. We hope this series will continue to be useful in this regard.

The Center for Business and Economic Research at the University of Tennessee has again helped make possible this analysis by generously providing for the use of computer facilities and the able assistance of staff. Particular acknowledgement is made to Vernon Roddy for data programming responsibilities, to Mary Brashear for data compilation, Jeanne Mecklin and Jane Davis for editorial assistance, and to Patricia Hunley and Susannah Prescott, typists-- all members of the Center staff.

INTRODUCTION

For the eighth consecutive year, the Southern Regional Education Board is reporting on state and local tax performance. Statistical data and comparisons for the 50 states and the District of Columbia on state and local tax effort, (measured by utilized potential as reflected in collections, and unutilized potential as reflected by relating collections to a common tax base), have been compiled to serve as a guide to public officials who may wish to evaluate their jurisdictions' tax performances in the light of what neighboring jurisdictions are doing.

It is not the purpose of these reports or others in the series, nor is it the intent in any fashion, to suggest or recommend that public officials ought to search out sources of new revenue or that any particular jurisdiction should reform its revenue structure. Neither is it the purpose or intent to suggest that a particular state should strive to achieve the averages in tax effort upon which the analysis and comparisons rest. Particular conditions in a state may dictate that a state employ one tax in lieu of another or that the state should exceed or fall short of the aggregate effort of all states. It is left to each public official to evaluate his jurisdiction's effort and needs in relation to its economic, political and social characteristics and then decide on a course of action. The worth of the report lies in its value as a reference and guide to aid officials in reaching the proper decisions in tax policy. Statistical tables contained in the report provide the background that is critical to public officials

wishing to alter tax policy in some form, while wishing to maintain tax effort and tax structures comparable and competitive with those in neighboring jurisdictions.

One of the most complex and volatile problems of public life today is that of financing state and local public services. In the years since 1967, when the Southern Regional Education Board (SREB) began publishing the annual survey of state and local revenues and potentials, the nation has struggled through international crises in the form of hot wars, cold wars and economic warfare. It has also endured recessions accompanied by high inflation and prosperity with both inflation and high unemployment. Every turn of events seems to bring new public demands and ultimately greater financing efforts. As tax revenues have continued their ever-upward climb, along with the ability of taxpayers to pay higher levies, so also the amount of unutilized potential has increased. The ability to raise additional tax revenue, however, is not evenly distributed.

Economic forces of the early 1970's and the introduction of revenue sharing in 1972 combined to provide most states with significant budget surpluses. By 1974 budget surpluses had largely disappeared. In 1975 one can expect the inflationary pressures to generate further budget shortfalls. The severity of the recession, now hopefully ended, combined with the prior inflation is now forcing at least two-fifths of the states and many local governments to take significant budget cutting or revenue raising actions.¹ As new public budgets are prepared for 1976 and 1977,

1. See "The Money Crunch for States and Cities," The Nation's Business, October 1975, pp. 22-28.

many will again be unbalanced unless expenditure programs are accompanied by substantial tax increases.

In 1974 and early 1975, expenditure cutbacks and delays in capital construction have been quite common. One major consequence of cutbacks and postponements will be an increase in unutilized potential. While cutbacks in some jurisdictions will undoubtedly be offset by increases in the more financially fortunate ones, the growth rate in state and local public expenditures will be reduced in 1975 and 1976. However, the growth rate will be sustained somewhat by a large number of tax increases (more than in 1972 and 1973) and by a lesser number of new tax exemptions and tax cutting measures.

In summary, it is expected that state and local governments will hold the line on expenditures and increase taxes in the near future. One consequence will be the stabilization of tax burdens in relation to personal income. The net result is likely to be a decline in the rate of growth in taxes, an increase in unutilized tax potential and a deterioration in the quality and quantity of critical public services in many areas.

METHODOLOGY

This is a tax effort study. Such studies are presumed to gauge the extent to which a jurisdiction taps its available taxable resources. An aggregate of total taxable resources or absolute tax capacity is not readily available, so proxies representing taxable resources are generally used in tax effort studies.

In this study tax effort is compared in two ways; the tax effort performance of each state is measured for the 14 most productive state tax sources, and the differences in performance are computed for each of the 50 states and the District of Columbia. Comparisons are possible because a standard proxy has been selected for each of several major tax sources.

A state's personal income is used as the proxy, or common denominator, for comparing tax effort in most tax categories. While not a perfect representative of tax capacity, personal income is an important determinant of expenditures on retail goods and services that make up the bulk of general and selective sales tax bases and the individual income tax base. Personal income is a satisfactory proxy only if the actual tax base and personal income can be related meaningfully and consistently. It is not fully satisfactory as a proxy for corporate or property taxes, but no better simple measure is readily available. Other proxies are more suitable for measuring tax potential and effort in almost three cases. Some states rich in income are poor in natural resources. Therefore, the value of natural resources severed from the land and waters of the state is a more reliable indicator of tax capacity against which to measure effort. For motor vehicle related taxes

(sales taxes on motor fuels and license taxes on motor vehicles), a more suitable common denominator seems to be the number of registered motor vehicles.

In interstate comparisons, the basic statistical approach rests on the assumption that all states apply the average effort to collect revenue from each particular tax source. (However, as stated in another section, it is not always realistic to expect this.) Average effort is expressed as the average rate per \$1,000 of personal income, per \$1,000 of severance products, or per registered motor vehicle for states using the particular tax. Under this average effort concept, states applying less than average rates will find their actual collections are less than potential collections. States applying rates in excess of the averages will collect above-average amounts of revenue.

Constitutional or other state or local constraints found in some states on the taxation of otherwise available taxable resources are assumed away in this analysis on the theory that the economic resources constitute a reasonable and viable tax base if used productively in many other states. In some jurisdictions political or social policy decisions have eliminated a source in spite of its administrative and economic feasibility and its availability. While such constraints reduce the utilization of the tax base, they do not remove the potential for use as defined herein.

Since there are many variations in the use of each taxable resource -- in the legal definitions of the tax, the tax base, the rates, and such -- it is convenient to accept the Bureau of the Census broad tax categories and collection data as reported in the various Census publications.

The Census gathers annually state and local tax amounts within a framework that groups taxes according to standard definitions. By using the standard Census compilations rather than diverse categories established at the state level, it is possible to make meaningful comparisons.

In the Census Bureau's annual publications, state tax collections are listed by tax source by state. Local property tax collections are listed by state, but local nonproperty taxes are listed by source as an aggregate figure for each of the 50 states and the District of Columbia. The totals were allocated to states by source with the help of sample data supplied by the Census Department. Local collections were added to state collections to compute state-local tax collections by source by state.

Finally, adjustment was made in two taxes on the assumption that net profits from public owned enterprises is a form of tax on the consumer of the products. Net profits from state and municipally owned liquor stores and public utilities were added to alcoholic beverage and public utility selective sales tax collections, respectively. Potential and unutilized potential collections as reported in this study were computed from the basic collection data.

In summary, the statistical calculations are achieved in three steps:

- (1) An average rate, based on the most relevant proxy, was computed for each tax for states using the particular source.
- (2) The average rate was multiplied by the proxy for each state to compute a potential tax collection amount.
- (3) The actual state-local collection was subtracted from the

potential in order to generate an unutilized potential amount. However, if the actual was more than the potential, no unutilized potential existed and unutilized potential is reported as zero in the statistical tables.

SOURCES OF DATA

The basic statistical data needed to support this study were supplied by the U.S. Bureau of the Census. State tax collections were published in State Government Finances in 1974, GF74 No. 3. Aggregate local taxes (for the 50 states and the District of Columbia) by tax source were published in Governmental Finances in 1973-74, GF74 No. 5 and allocated to states on the basis of unpublished sample data graciously supplied by the Bureau.² Data on finances of publicly owned liquor stores and public utilities were published in State Government Finances in 1974 and Governmental Finances in 1973-74, respectively. Data on personal income and population were reported in the Survey of Current Business (August 1975) and Current Population Reports, Series P-25, respectively.

Information on tax rates and tax changes enacted by the states in 1974 and 1975 came from published reports of the Commerce Clearing House, from the Federation of Tax Administrators, and from the states themselves.

2. Special thanks for supplying data prior to publication and unpublished data that made our allocation efforts possible are extended to Maurice Criz and Vance Kane of the U.S. Department of Commerce Bureau of the Census.

THE STATISTICAL TABLES

The statistical portion of this report consists of a series of 12 basic tables (Tables 1-12), 25 analytical tables (Tables 13-37) and eight summary tables (Tables A-H); four other tables (Tables J-M) present tax rates currently applicable. The numbered tables are identical to tables presented in State and Local Revenue Potential, 1973. The summary tables present the same data as the lettered tables in the 1973 report, but are lettered differently. A number of comparative devices have been employed to assist the users of the report.

State and local taxes are compared in terms of both personal income and population. Both measures are useful and widely used, but for tax effort comparisons, income is perhaps the more appropriate. The primary argument in favor of the use of income is that taxes are ultimately paid out of current income. A second argument is that personal income seems to have a measurable relationship to most tax bases. As a measure of tax effort population is less useful because a population's capacity to pay taxes is not related to numbers, but depends on the level of its income.

The average level and the distribution of personal income, as well as the aggregate level, influence a population's tax capacity and the level of effort a state may be inclined to apply. Table 19 reflects, in addition to collections as a percentage of income (Column 1), an effort ranking which reflects per capita personal income levels (Column 4). In simple terms, this ranking shows that a tax effort equal to 10 percent of personal income is a greater burden if average income is low than if it is high.

In neither measure is the possibility of tax "exporting" or the differences in distribution of incomes among the taxpayers considered. In Table 35 the distribution of taxpayers paying federal personal income tax by state by adjusted gross income class is shown. Both tax productivity and tax burden distribution are influenced by income distributions. The tax burden is probably directly related to the percentage of taxpayers in the lower income classes. This is especially significant for regressive taxes and less significant for progressive taxes.

Tax effort or burden is also influenced by the dependence of a jurisdiction on revenues from nontax sources and on federal revenues (grants-in-aid and shared taxes). Some states, by choice, garner relatively greater amounts of revenue from nontax sources and some are able to exact relatively great amounts of federal funds. The states' efforts and abilities in these areas are listed in Table 19 (Columns 2 and 3). Results shown here may help explain state differences in tax efforts reflected in other tables.

Some public officials may want to compare underutilization of some tax sources with overutilization of other tax sources. Tables 20 through 34 list both the over and underutilization of taxes by major source for the SREB states and the net over or underutilization. Table 36 shows the net unutilized capacity (only) for all states and the District of Columbia. This table also presents the total of actual collections and net unutilized capacity as a measure of aggregate tax capacity. Additional columns in the table indicate the percent of capacity unutilized and the capacity and utilization per capita and per \$1,000 of personal income by state. In general the greatest net underutilization is found in the SREB states

and in a few midwestern states while the greatest overutilization is found in the northeastern and far western states.

SOME GUIDES IN UTILIZING THE REPORT

In this study the measure of each tax potential is represented by a proxy (personal income, etc.). However, the relationship may not always be as close as desired. For example, the relationship of the property tax base and the corporate income tax base may vary from state to state and from time to time.

Some types of taxes are not uniformly available in all states. Sometimes this is highlighted by the use of the proper proxy. For example, a few states with extensive extractive industries can use severance taxes productively; others, poor in natural resources, cannot. The differences show up in the proxy, the value of severed products.

A few states can tax the tourist industry extensively (Florida and California, especially) and the securities exchange business is largely concentrated in New York. These activities enhance revenues in the fortunate states. Finally, social aversion to participating in certain taxable activities (e.g., indisposition to consume alcoholic beverages or to participate in gambling activities) inhibit tax collections in some states, while in one state, Nevada which has gambling taxes, the disposition to participate in similar activities is vigorously exploited. These dispositions may not influence the proxies but may have substantial effect on the productivity of taxes.

While this is essentially an effort study, some attention is given to tax burdens and burden distribution. Data in Tables 19 and 35 offer

some assistance to the decision makers in assessing the gross tax burden in relation to total and per capita personal income and to the distribution of federal adjusted gross income.

The study seems to imply that each state should be able to maintain its current level of tax collections from sources for which the state's effort is average or above, and still increase collections from sources for which its efforts are below average. A reference to Tables 20-34 and 36 indicates that this is not necessarily so. Taxpayers paying high taxes of a particular type (e.g., consumption) would have their capacity to pay other taxes (e.g., income or property) seriously impaired. The overall level of taxation and the net over or under-utilization must be considered. In some states more than in others, taxpayers are contributing more to the public treasury relative to their ability to pay.

Finally, the distribution of personal income and the distribution of the tax load should be considered in tax policy. Burdens and efforts are especially onerous if the tax system is regressive and the personal income distribution is skewed toward the low income taxpayers.³ The burdens (in contrast to the impact) of business taxes must also enter into the assessment process. Some states find it relatively easy to levy taxes that can be largely "exported" to nonresidents. It may be difficult to justify a tax increase in states in which above average total effort is being made even if specific areas of below average effort are evident.

3. A tax is regressive if the tax liability as a percentage of income increases as taxpayer income decreases. A tax is proportional if the percentage of income paid in taxes remains constant for all income levels. A tax is progressive if the percentage of income paid in taxes increases as income increases.

It is even more difficult to justify a tax increase if a large share of the tax burden falls on low income resident taxpayers.

Tax burdens may be related to the average personal income and to its distribution as well as to total personal income. An aggregate tax levy of 10 percent of personal income may not be as burdensome in states where per capita income is high and more taxpayers are in the upper income classes than in states which are less fortunate. However, the less fortunate and currently less tax burdened states in this respect may find it necessary to levy additional taxes in order to provide a reasonable possibility of providing adequate services to promote stable economic growth.

AN OVERVIEW, 1967 TO 1974

The statistics in Table A indicate that state and local tax collections in 1974 were up 116 percent over the 1967 level, increasing from \$61,429 million to \$132,501 million. Over the period, however, the growth rate has slowed. From 1967 to 1970, the growth averaged 14.7 percent; from 1970 to 1973, the average was 13.0 percent; and from 1973 to 1974, the growth was only 7.8 percent. Percentage increases seem to be related closely to the responsiveness of taxes to economic growth and overall productivity. The most responsive tax, the individual income tax, was the leader, followed by the corporation income taxes, general sales taxes, and property taxes. Indirect (business) taxes and direct taxes seem to have grown about equally, though no accurate evaluation of comparative growth is available.

Over the years 1967 to 1974, unutilized potential has increased for every major tax category. The overall growth of 112 percent, from \$11,645

* Does not include "other selective sales taxes" for years 1967 to 1971. Excluding "other selective sales taxes," figures for 1972 and 1973 are \$1,822,196 and \$1,997,439 (in thousands) respectively. Growth rates then would be 64.3 percent and 80.0 percent.

Source: Kenneth E. Quindry, State and Local Revenue Potential, 1967 (Atlanta: Southern Regional Education Board, 1969). Tables A-2 - A-9; Statistical Supplement to State and Local Revenue Potential, 1968, Table 16; State and Local Revenue Potential, 1969, Table A-11; State and Local Revenue Potential, 1971, Table 12; State and Local Revenue Potential, 1972, Table 12; Kenneth E. Quindry and Carol S. Meyers, State and Local Revenue Potential, 1973, Table 12; and Table 12 this report.

million in 1967 to \$24,645 million in 1974, centers mostly in three tax categories, one related directly and positively to personal income--the individual income tax--and one to sumptuary taxes--the selective sales taxes. The third one was the major local (property) tax for which no alternative source was available to finance growing local expenditure demands. In 1974, the unutilized potential for corporation income taxes was reduced due to high corporation profits in 1973. The fuel shortages and higher prices that restricted the number of vehicles led to a substantial growth in motor vehicle fuel taxes' unutilized potential. The growing general sales tax exemptions were perhaps responsible for the substantial increase in unutilized potential for the general sales taxes.

AN OVERVIEW OF 1973 AND 1974

Personal income in the 50 states and the District of Columbia increased by 5.8 percent in 1974 over 1973 while state and local taxes as measured in this report increased by 7.8 percent. This implies a statistically insignificant change in taxes as a percentage of income. In general, states in the East and West were most successful in reducing tax effort as measured by personal income. Ten of 12 North Central states increased efforts while the SREB and Mountain states were fairly evenly divided between those increasing or not reducing efforts and those decreasing their state-local tax effort.

In 1974 states utilized 95.6 percent of their capacity as opposed to 95.8 percent in 1973. In per capita terms, tax capacity in 1974 equalled \$656, leaving \$29 unutilized. Respective figures for 1973 were \$611 and \$26. Capacity per \$1,000 of personal income was \$121 in both

1973 and 1974. However, utilization decreased from \$116 in 1973 to \$115 in 1974.

Percentage growth in the general sales taxes for both collections and unutilized potential are indicated by data in Tables A and B. Motor vehicle fuels taxes showed the least revenue growth and were almost equal in unutilized potential growth, possibly due to fewer miles traveled by the average automobile. Overall growth in collections and potential was substantially equal, 7.8 percent to 7.2 percent, respectively.

TAX COLLECTIONS IN FISCAL 1974

State and local tax collections and related unutilized potential collections by state and by source along with comparative tax efforts are reported in 37 statistical tables. In this section major sources are summarized by geographic region in eight letter-designated tables. The reader can refer to the tables headed with numbers for specific state data. In some cases, normal annual collections are inflated by windfall amounts. In others tax rates or base changes may have increased or reduced collections for only a portion of the year. No attempt is made to note all such instances.

Tax Collections and Unutilized Potential

State and local tax collections increased to \$132,501 million in 1974, from \$122,889 million in 1973. The 7.8 percent growth was substantially below the 11.3 percent registered from 1972 to 1973. The increases by type of tax are listed in Table A and by geographic region in Table C. Rate and base changes were of relatively minor influence in increasing taxes, but of some influence in reducing taxes in a few states during

TABLE C

TAX COLLECTIONS AND UNUTILIZED POTENTIAL BY REGION,
1973 AND 1974, WITH PERCENTAGE CHANGE

Region	Tax Collections (amounts in millions)		Unutilized Potential (amounts in millions)			
	1973	1974	Percentage Change	1973	1974	Percentage Change

the year. Relative growth by source reflected largely the degree of responsiveness to economic growth. Motor vehicle related taxes were also affected by the fuel shortages. Corporation income taxes reflected the continued favorable corporate profits figure through the first half of 1974.

Property tax growth was no doubt limited by the introduction of federal revenue sharing. Growth in tax collections in excess of the 7.8 percent national average was registered in three geographic regions, the Southern Regional Education Board states, the Mountain states, and the North Central states. These regions reacted less to reduce taxes in the face of pending surpluses, and they depended more on consumption and business taxes which performed well during the year.

Unutilized tax potential increased less rapidly than did collections. As expected unutilized potential growth was least in regions where tax increases were greatest. Thus, the North Central states, the Southern Regional Education Board states and the Mountain states lagged behind the national average while the remaining regions exceeded it. In total, the unutilized potential increased to \$24,645 million from \$22,994 million, an increase of 7.2 percent. Three major sources accounted for 70.1 percent of collections and 73.2 percent of the unutilized potential in 1974. They were the general sales and gross receipts taxes, the property taxes and the individual income taxes.

In the following pages, the performance of the states in employing the major tax sources is examined individually.

The General Sales and Use Taxes (Tables 1 and 13)

Whether a state garners revenue in excess of or below the national average as computed by use of a proxy base is determined primarily by the rate level, the extent of the base and the vigor of the administration. State rates for general sales taxes vary from 2.0 percent to 7.0 percent. Also, 26 states permit the use of additional local rates. Widespread use of these rates is found in Alabama, California, Illinois, North Carolina, Ohio, Oklahoma, Tennessee and Texas. In several other states, major counties or cities demonstrate heavy dependence on this source. In a few states, the local rates are almost universal, and Alaska has only a local rate. In many states, major items related to manufacturing, pollution control and agriculture are subject to special lower rates.

While tax bases for the general sales taxes are complex, a casual examination can isolate major items of exclusion or inclusion which are major determinants of productivity. Such items include the extent of taxation of food, drugs and utilities; the extent of taxation of the sale of services; and the extent of taxation of items utilized in business activity. Motor vehicles are also given special treatment in a few cases. A few states tax gasoline under both the general sales taxes and the selective gasoline sales taxes. Four states (Delaware, Montana, Oregon and New Hampshire) continued to finance their governments without resorting to general sales taxation.

General sales tax revenues increased to \$26,314 million from \$22,992 million in 1973, a 14.4 percent increase, while unutilized potential grew to \$3,394 million, an almost identical percentage growth (14.2 percent).

Source: Kenneth E. Quindry and Carol S. Meyers, State and Local Revenue Potential, 1973, (Atlanta: Southern Regional Education Board, 1974), Table 1; and Table 1 this report.

The New England states continued to be relatively light users of this source (See Table D). The areas and states making substantial collection gains reflected slowly rising unutilized potential amounts with the exception of the Pacific states. In this case growth in sales tax capacity permitted growth in both areas.

Data in Table D indicate that the western part of the United States employs general sales taxes rather extensively. The Middle Atlantic states of New York and Pennsylvania use the source intensively at both the state and local levels. With the exception of Maryland and Virginia, the SREB states also make widespread use of the source. In total, the data of Table 1 indicate that 22 states overutilize the source to some degree, eight of which are SREB states. For states using the tax, collections per \$1,000 of personal income increased to \$23.38 in 1974 from \$22.18 in 1973.

The Selective Sales Taxes (Tables 2 and 14)

Collection data and unutilized potential collections for four major selective sales taxes and "all other" selective sales taxes are presented in Table 2 and analyzed and summarized in Tables 14 and E. In 1974, collections amounted to \$12,638 million, an increase of 4.2 percent over 1973 collections. In every category, tax collections per \$1,000 of personal income were reduced in 1974. The result was a nominal growth in unutilized potential in spite of only a few rate increases.

Net profits of publicly owned utilities and liquor stores are defined as taxes and included in the measure of taxes in this report. States garnering such revenues which can be included conceivably in governmental general revenues are listed in the notes to Table 2.

TABLE E

Source: Kenneth E. Quindry and Carol S. Meyers, State and Local Revenue Potential, 1973 (Atlanta: Southern Regional Education Board, 1974), Tables 2 and 12; and Tables 2 and 12 this report.

Alcoholic beverage, cigarette, and insurance premiums sales taxes are reported in every state and the District of Columbia. One state (Massachusetts) did not report revenue from public utility taxes or profits. In general, productivity of these taxes depends heavily on the level of the rates. In about one-third of the states sale of tobacco products other than cigarettes are taxed.

Because of continued low cigarette tax rates in North Carolina (2 cents), Kentucky (3 cents) and Virginia (2.5 cents), the SREB states continued to rank low in tobacco tax collections. Per capita collections and unutilized potential increased from 1973 to 1974, collections from \$57.80 to \$59.78 and unutilized potential from \$12.32 to \$12.61. However, collections per \$1,000 of personal income were reduced to \$11 from \$11.47; in 1973 unutilized potential per \$1,000 of personal income fell also, to \$2.32 from \$2.44.

Overall, the SREB states continued to demonstrate the most intensive use of selective sales taxes. These states reduced appreciably their unutilized potential in 1974.

Death and Gift Taxes (Table 3)

In all states (except Nevada which does not employ this tax source) the tax rates are graduated and separate rate schedules are used for heirs, depending on their relationship with the deceased or donor.

Some states levy a death tax solely for purposes of recovering the federal tax credit--the so-called "pick-up" tax. Other states employ an additional estate or inheritance tax or both. Sixteen states levy a gift

tax.⁴ Five states (Alabama, Alaska, Arkansas, Florida and Georgia) use the "pick-up" tax only, two states (South Dakota and West Virginia) use an inheritance tax only; two states (Oregon and Rhode Island) employ all three types of levy; two states (Mississippi and North Dakota) use an estate tax only; seven states (Arizona, New York, Ohio, Oklahoma, South Carolina, Utah and Vermont) use an estate and "pick-up" tax.

Over one-third of the taxes were collected in the New England and Middle Atlantic states in which no unutilized potential is evident. Another two-fifths of the taxes were collected in the North Central and the SREB states in which 90 percent of the unutilized potential was found. Taxes per \$1,000 of personal income declined to \$1.25 in 1974 from \$1.36 in 1973.

The Property Taxes (Tables 4 and 15)

The Northeastern states continued to use the property tax more intensively than any other area in 1974, and it was the only region in which no unutilized potential existed. On the other hand, the SREB states demonstrated the least intensive use and the greatest unutilized potential. No SREB state achieved its potential, and four states collected less than half the amount suggested by the use of the average national rate.

In spite of the poor showing, the SREB growth rate was impressive, thus minimizing the increase in unutilized potential. The increase in unutilized potential was striking in the Middle Atlantic and Mountain

TOTAL	\$45,288	\$47,760	5.5	\$6,372	\$6,692
					4.9

Source: Kenneth E. Quindry and Carol S. Meyers, State and Local Revenue Potential, 1973 (Atlanta:
Southern Regional Education Board, 1974), Table 4; and Table 4 this report.

states where collections grew only moderately (Table F). Between 1973 and 1974 per capita collections in the nation increased from \$216 to \$226 and per capita unutilized potential from \$30.36 to \$31.66. On the other hand, collections per \$1,000 of personal income fell by approximately \$1.00 and unutilized potential, a few cents.

While property taxes remained the most important source of state and local revenue, the percentage of taxes garnered from this source declined from 36.9 in 1973 to 36.0 in 1974. Even some of the moderate growth in collections was illusory. The aggregate collections as reported may be reduced by property tax relief that in many states appears as an expenditure item or as a credit against another tax rather than as a reduction in property taxes. All 50 states and the District of Columbia have some form of property tax relief aimed specifically toward the aged, disabled, or low income; in two-thirds of the states, it is granted at the state level.

Because of these complex procedures in collections and relief, it is difficult to compare accurately the tax effort from state to state or from region to region. However, there is little doubt that a regional difference in effort does occur.

The Individual Income Taxes (Tables 5 and 16)

Practices in the use of individual income taxes did not change much from 1973 to 1974 except that a few states, California in particular, reduced rates or provided new and increased exemptions because of pending budget surpluses. Six states (Florida, Nevada, South Dakota, Texas, Washington, and Wyoming) still did not employ the tax, and four states

Source: Kenneth E. Quindry and Carol S. Meyers, State and Local Revenue Potential, 1973 (Atlanta: Southern Regional Education Board, 1974), Table 5; and Table 5 this report.

(Connecticut, New Hampshire, New Jersey and Tennessee) used it sparingly. The remaining 40 states have broad-based income taxes but the intensity of imposition varies considerably. In addition to the state rates, ten states (Delaware, New York, Pennsylvania, Michigan, Missouri, Ohio, Alabama, Kentucky, Maryland and California) permit a local levy in one or more jurisdictions. Thirty-five states employ progressive rate structures and five (Illinois, Indiana, Nebraska, Ohio and Pennsylvania) employ flat rates.

The two major controllable influences on tax productivity are the tax rate structures and deduction and exemption policies. An examination of these factors will generally provide the key to productivity levels.

Productivity, however, may be influenced by the distribution of taxable income. If a high proportion of the taxpayers is in low income classes, other things being equal, productivity will be low; moreover, a great number of low income families may restrict potential use of the source. Conversely, a great percentage of taxpayers in the middle and upper income classes signifies that the tax will be productive. The distribution of taxpayers for federal income tax purposes by adjusted gross income class in 1972 is shown in Table 35.

The SREB states made less use of the individual income tax in 1974 than other regions, primarily because Florida and Texas failed to use it, and Tennessee used it only sparingly. Exemption policies in Louisiana and Mississippi restricted the productivity in those states. Only Maryland collected above average amounts of revenue from this source.

Collections increased in 1974 in every geographic region except the Pacific region. California reduced its tax effort by instituting sub-

stantial tax credits which resulted in a gain in unutilized potential for the Pacific region. On the other hand, two regions (the North Central and the Mountain states) show reduced underutilization and substantial revenue growth.

For the nation, collections reached \$19,466 million in 1974, up from \$17,970 in 1973 (8.3 percent increase). Unutilized potential reached \$7,963 million, an increase of 7.9 percent in 1974.

The Corporate Income Taxes (Tables 5 and 17)

Following two years of growth in excess of 20 percent, corporate tax revenue growth slowed to one-half that amount (10.8 percent). The unutilized annual potential growth rate was 3.8 percent in 1974 as opposed to 13.1 percent in 1973 (Tables H and 17). Collections in 1974 amounted to \$6,040 million while unutilized potential was \$1,501 million.

Per capita collections increased to \$28.57 in 1974 while collections per \$1,000 of personal income reached \$5.26 (Table 17); both figures were slightly larger than those reported in 1973. A similar small rise in unutilized potential is evident in per capita terms while a small reduction in the amount per \$1,000 of personal income is seen.

In analyzing state performance, the same factors which may be dominant in determining productivity for individual income taxes should be examined for corporate income taxes. Productivity is influenced by the comprehensiveness of the gross base, the deduction policies and the tax rate, as well as the extent of tax credits.

Tax bases and deduction policies are being standardized along federal lines so that differences in these areas are minimized. Thus, the relative

TABLE H
STATE AND LOCAL CORPORATE INCOME TAXES, COLLECTIONS AND UNUTILIZED POTENTIAL
BY REGION, 1973 AND 1974, WITH PERCENTAGE CHANGE

Region	Tax Collections (amounts in millions)			Unutilized Potential (amounts in millions)		Percentage Change
	1973	1974	Percentage Change	1973	1974	
New England States	\$ 466	\$ 503	7.9	\$ 17	\$ 17	--

Note: Parts may not add to total due to rounding.

Source: Kenneth E. Quindry and Carol S. Meyers, State and Local Revenue Potential, 1973 (Atlanta: Southern Regional Education Board, 1974), Table 5; and Table 5 this report.

rate is the primary significant factor in relative productivity.

In three of the six geographic regions, the Pacific states, the SREB states, and the Mountain states, revenue productivity and unutilized potential both exceeded the national average increase of 10.8 percent and 3.8 percent respectively. In two regions the unutilized potential remained unchanged in 1974 and in one it was reduced. The Mountain and the SREB states performed well in corporate income tax collections in spite of the fact that one SREB state (Texas) and two Mountain states (Nevada and Wyoming) do not employ the tax. Washington state also did not use the tax in 1974.

Licenses and Motor Fuels Taxes (Tables 6, 7, and 8)

Tax performance for two major license taxes (alcoholic beverage licenses in Table 6 and motor vehicle licenses in Table 7) and motor vehicle fuels taxes (Table 8) are discussed in this section. Other license taxes are listed in Table 11. Motor fuels taxes are discussed along with vehicle license taxes (rather than with selective sales taxes in Table 2) because both vehicle related taxes are usually earmarked for highway construction and maintenance. With one exception, all states and the District of Columbia employ all three sources.

Alcoholic Beverage Licenses (Table 6)

License taxes are placed by the states on sellers, handlers, and producers of alcoholic beverage products in every state except Hawaii. Localities in most states also collect revenue from this source, but disaggregated local collections data are unavailable. Local collections are included in "other and unallocable taxes" in Table 11.

The fact that publicly owned liquor stores are not subject to license fees in all cases may affect productivity in a number of states. In several states pockets of prohibition and abstinence restrict collections. In a few states special tax concessions are granted to local producers.

Revenues from this source grew to \$142.9 million in 1974. This was almost one percent above 1973 collections. Unutilized potential declined to \$42.9 million from \$44.1 million in 1973. Aggregate capacity for use of this source in both the New England states and the Western states was relatively minimal. Consequently, almost 75 percent of the collections and 80 percent of the unutilized potential were located in the Middle Atlantic states, the North Central states, and the SREB states.

Motor Vehicle Related Taxes (Tables 7 and 8)

The motor vehicle related taxes discussed in this section are of two types--the license taxes and the fuels taxes. The license taxes may be a flat fee per vehicle, or a graduated fee based on weight or horsepower. In the case of trucks it may be related to miles driven in the state. The fuels tax is a gallonage tax based on sales of gasoline or other fuels used to operate motor vehicles on public highways. Minor revenues may come from the sale of fuels for use in boats and airplanes.

Motor vehicle related taxes are reported in Tables 7 and 8 and compared according to revenue per registered vehicle. The widespread dependence on motor vehicles for transportation and the fact that the taxes are related to numbers and use suggest that the tax collections are related more to numbers than to the personal income of the population.

An average collection per registered vehicle is the common denominator used. All states and the District of Columbia use these tax sources.

While several explanations for differences in productivity of these taxes may be offered, the primary reason is the difference in tax rates. This may be explained by the fact that some states depend more heavily than others on motor vehicle use revenue to support their highway programs. Minor differences result from the varying ratios of automobiles to trucks and buses. In several states motor vehicles are subjected to significant property taxes, and fuels to general sales taxes. In at least 21 states (10 in the SREB region and six in the North Central Region), local license or inspection fees are permitted. Use of local motor fuels taxes is less common.

Revenue from license taxes increased to \$3,755 million in 1974 from \$3,635 million in 1973 (3.3 percent). The higher collections were rather evenly spread by geographic regions. On the other hand, unutilized potential was reduced to \$486 million in 1974 from \$505 million in 1973. Unutilized potential was less in the SREB states, the Mountain states and the Pacific states, more in the North Central states and substantially unchanged elsewhere.

Changes in motor fuels tax collections seem to vary from 1973 to 1974 depending on the seriousness of the fuel shortage. Three of the nation's favorably situated areas found collections advancing and three less favorably situated found collections receding. In all cases the movement was slight. For the nation the collections increased a minimal 1.9 percent. Unutilized potential increased to \$525 million from \$460 million.

Severance Taxes (Table 9)

Severance taxes are imposed on the value of natural resources as they are severed from the land or water. They can be used productively only in states having significant amounts of commercial extractive activities. The most productive taxes are applied in states having high concentrations of petroleum and gas. In a few states coal production has or can become a significant tax activity. Production of timber, fish, shellfish, salt, stone, sand, gravel, iron ore and other minerals is also taxed, but frequently the tax is regulatory and not expected to be a major revenue producer.

Because only a few states have significant commercial extractive industries, the value of severed products is considered to be the proper measure of tax potential. The common measure is collections per \$1,000 of severed products.

Louisiana, Texas and Oklahoma are unique in their ability to exploit oil and gas severance taxes. Other oil producing states use their potential less intensively. Kentucky has made use of its potential in coal severance in the last two years, while Tennessee has a negligible coal severance tax for local highway use. West Virginia employs a gross receipts tax on coal production that is reported in the general sales tax figures, and Minnesota levies a reasonable iron ore severance tax.

Over half of the value of severed products is found in the SREB states, one-third in Texas and Louisiana. Because these states employ the tax intensively, the unutilized potential is not concentrated in the SREB states. Nation-wide collections increased to \$1,255 million in 1974 from \$850 million in 1973. The substantial increase is likely to

be repeated in the next few years as states search for new and under-used tax sources to supplement the major sources.

Transfer Taxes (Table 10)

Transfer taxes are levied on transfers of real estate and on transfers of nontangible wealth (mortgages, stocks, bonds). In some states the coverage is restricted to real estate, while in others the most productive source is stock transfers. Productivity is affected first by the coverage and second by the rate levels.

New York is in an especially favorable position to garner revenue from a documentary transfer tax. Over 42 percent of the total tax reported for states in 1974 was collected in that state.

Data in Table 10, however, are not fully representative of the extent of this tax. Some states permit local governments to levy the tax. Local data are not available on a state basis and are included in "other and unallocable" taxes in Table 11.

Transfer taxes decreased to \$497 million in 1974, a reduction of almost 14 percent from 1973 figures. Unutilized potential was substantially unchanged, declining by \$26 million to \$413 million.

Miscellaneous, Other and Unallocable Taxes,
Total Taxes (Table 11)

Two other tax sources, parimutuel and lottery taxes, are used productively in a few states. Parimutuel taxes are used reasonably efficiently in a few states in which the traditions of horse and dog racing are strong. The attraction of the states for tourism also benefits tax collections. In other states, legal prohibitions still are in effect.

New York has extended wagering to off-track betting. Parimutuel collections are listed in Column 1 of Table 11.

State lotteries are being used in about one-fifth of the states and others are seriously considering their adoption. As with parimutuel betting, legal prohibitions and lack of social acceptance still exist in many states.

As with severance taxes, these two sources are relatively underused in many states and because of this, many states will be examining the possibilities seriously in the next few years.

MAJOR TAX ACTIONS IN 1974

In 1974 there were few major tax measures. The economic slowdown had not affected the tax picture at that time, and tax breaks outnumbered tax increases.

Only two states increased the general sales and use tax rates. Arizona changed its rate from 3.0 to 4.0 percent, and California's rate increased from 3.75 to 4.75 percent (this had been legislated in 1972). In addition, New York City temporarily raised its rate, and Virginia and South Dakota broadened their sales tax bases. On the other hand, Connecticut reduced its general rate from 6.5 percent to 6.0 percent, and many states enacted exemptions. These exemptions were particularly in the areas of drugs and medical supplies, and special treatment of items for the elderly (Idaho, Illinois, Indiana and Wyoming) and poor (Colorado and Nebraska).

In 1974 Illinois authorized municipal and county use taxes not to exceed 1.0 percent. Taxes for public transit existed in California and were enacted (upon referendum) in Ohio, Utah and Washington.

No state raised individual income taxes in 1974, and decreases were effected in New Mexico, Nebraska, Pennsylvania and New Jersey (applicable to Pennsylvania commuters only). Among the states raising personal exemptions or deductions were Ohio, Montana and Iowa, and various other states extended credits and deductions in specific areas, particularly to the elderly.

The corporate income tax rate was increased in Arizona in all tax brackets, and Vermont graduated its rates which shifted the burden and effectively raised the amount garnered from this tax. Rates were lowered

in Nebraska and Pennsylvania, and selective relief was granted in a few other states.

Property tax action was chiefly in the area of relief for the elderly, the poor and the disabled with at least 19 states enacting such legislation. Realty tax deferral measures were initiated in Massachusetts and the District of Columbia, again benefiting the lower income and elderly homeowners. Other prevalent realty tax changes included new assessment ratios for different classes of property, and use value rather than market value as the basis for evaluation of agricultural and open space land.

Increases in the cigarette tax rate were enacted in 1974 in Arizona and Maine, while Rhode Island exempted all tobacco products except cigarettes. Arizona and Montana increased the alcoholic beverage tax rates. In contrast to 1975, motor fuels taxes were increased in only two states, Arizona and Pennsylvania, while Delaware continued its increased rate. Current (1975) rates applicable in all states are shown in Tables J through M.

MAJOR TAX ACTIONS IN 1975

Tax actions in 1975 have centered on motor fuel taxes and adjustments in exemptions in other taxes. Because of surpluses in funds in fiscal 1973 and 1974 some state legislatures extended exemptions in specific tax areas. A number of states removed the sales tax on food and prescription drugs or enacted income tax credit for sales taxes paid on such items as medicine and medical and dental services. Circuit breaker clauses and homestead exemptions for senior citizens and the disabled were enacted in various property tax modifications in several states,

and property tax incentives for solar heating systems were enacted by seven states in 1975. Several states have tried to more equitably distribute the burden of personal income tax by making adjustments favoring the low income bracket. With money now becoming much tighter, it is unlikely that much tax relief will be enacted in the upcoming legislative sessions.

On the other hand, motor fuel tax rate increases have been passed by seven legislatures, and several states have raised corporation income tax rates. Increases have been enacted also in alcoholic beverage tax rates in a few states as well as in some other minor taxes.

General Sales Taxes

Sales taxes are currently in effect in 45 states and the District of Columbia. Of these, 21 states exempt food consumed off the premises of the seller, and the District of Columbia imposes a lowered rate on food. Prescription drugs are exempted by 33 states and the District of Columbia, with two others (Alabama and South Carolina) making concessions for the elderly. Thus, the regressive effects of the sales tax have been reduced, with low income families who are burdened by the rising cost of food and drugs benefiting by a smaller proportion of their income going to sales taxes. The states with exemptions and tax credits in effect in 1975 are shown in Table J.

In addition to food and drug exemptions, many minor areas have received special attention in the guise of tax equity, which in reality has resulted from pressure group activities. Examples of special exemptions are sales tax exemptions for leased vessels used in the production

of minerals (Louisiana) and farm chemicals (Illinois).

The Arkansas legislature authorized the imposition of a sales and use tax on retail sales in cities with a population of more than 30,000 which are located in a county with boundaries adjoining some other state; within 30 days after adoption of the tax an election must be held on the question of whether the tax should be imposed. Washington authorized additional local sales and use taxes to finance public transportation.

New York City has extended its sales tax rate of 4 percent through June 30, 1976, after which it will drop to 3 percent. New York City also imposes the sales tax on many services, and Connecticut extended its sales tax to certain services.

Sales tax rates range between a high of 7 percent in Connecticut and a low of 2 percent in Oklahoma, and the median rate for all states is 4 percent. Rates in effect in all states are shown in Table K. In the SREB states, Kentucky and Mississippi are high with 5 percent rates, while six states (Arkansas, Georgia, Louisiana, North Carolina, Virginia and West Virginia) have low rates of 3 percent.

Individual and Corporate Income Taxes

Individual income tax rates were raised in three states and adjusted in some others in 1975. Michigan increased its rate on individuals, estates and trusts from 3.9 percent to 4.6 percent of taxable income effective May 1, 1975; this rate is scheduled to drop to 4.4 percent on July 1, 1977. Rhode Island increased its income tax rate from 15 percent to 17 percent of federal income tax liability effective with the 1975 taxable year. Nebraska's income tax rate was raised from 10 percent to

12 percent of federal tax. New Jersey imposed a graduated tax on capital gains and other items of unearned income.

On the other hand, North Dakota modified the tax it is collecting by allowing a credit of 25 percent of the income tax liability but not more than \$100 of credit; this applies to taxable years 1975 and 1976 and is called "inflation credit." Oregon, New Mexico, and Idaho amended credits and deductions, and Iowa shifted tax burdens by reducing the rates in lower tax brackets and increasing the rates in higher brackets.

At the present time 44 states impose individual income taxes statewide; of these, 12 are SREB states. The Internal Revenue Code as currently in effect is the base for computation of taxes in 20 states, while the base for 12 states is the code in effect as of December 31, 1974, or January 1, 1975, (or other recent years).

A few states have made adjustments in their corporate income tax rates. Effective December 31, 1974, there was an increase from 5.5 percent to 7.25 percent in New Jersey's corporation business tax on net income. Also effective at the beginning of the year in Nebraska were increases from 2.5 percent for all corporations to 3 percent for corporations with taxable income of \$25,000 or less and 3.3 percent for corporations with taxable income over \$25,000. In Connecticut the corporate business tax rate was increased from 8 percent to 10 percent; Connecticut also raised its "additional" corporate business tax rates which vary with the kind of business being taxed. The base for corporate income tax in these states is the current Internal Revenue Code.

A gradual increase in corporate tax rates was authorized in Oregon with the initial increase being from 6 percent to 6.5 percent; finan-

cial institutions which were formerly taxed at 8 percent are now subject to the corporate excise (income) tax. Effective January 1, 1976, Michigan will have in effect a single business tax with a rate of 2.35 percent on the adjusted tax base; this is applicable to every individual, corporation, partnership, financial institution, and estate and trust with business activity located in or apportioned to Michigan. New Jersey also has extended its business taxes to include banking corporations while in Georgia the tax treatment of banks, trust companies and savings and loan associations was revised to exempt these institutions from paying the corporation income taxes (effective January 1, 1975). In the District of Columbia, the corporation income and unincorporated business tax rates will increase from 8 percent to 12 percent beginning January 1, 1975, for one year. Gross receipts and earnings tax rates are raised on utility companies, savings banks, building associations, and certain other financial institutions.

Other Taxes

In Table L the present motor fuel tax rates are shown. More changes have been made in these rates this year than those of any other tax. In this way states have been able to capitalize on the energy shortage.

Another direct result of the energy shortage is the new approach to property taxes which establishes tax incentives for solar energy systems. Indiana was the first to provide a tax deduction for solar heating systems (1974) and in 1975 seven states followed this lead. States having some type of legislation favorable to establishing solar heating and cooling systems are Colorado, Maryland, Montana, New Hampshire (subject to voter

approval), North Dakota, Oregon and South Dakota. No doubt other states will enact similar legislation in 1976.

A number of states broadened or increased property tax exemptions or credits to senior citizens or the disabled in 1975. These included Maine, New Hampshire, Kansas, Illinois, North Dakota, Utah, Arkansas, Ohio, New Jersey (subject to a referendum), Iowa, and Nevada. Illinois extended tax relief for the elderly to homestead improvements in counties with one million or more population.

Current cigarette tax rates in effect are shown in Table M. Only Maryland, Massachusetts, Rhode Island and the District of Columbia changed these rates during 1975.

California, Oregon, New Hampshire and Massachusetts increased taxes on alcoholic beverages in 1975. Oregon, Maine and Maryland increased inheritance tax rates, while Rhode Island increased the inheritance tax exemptions.

SUMMARY AND CONCLUSIONS

The data presented in the tables of this report indicate that tax growth has slowed relative to the economy for the second year. While taxes as a percent of personal income did not decline much, neither did they increase, as has been the long run trend. The major tax increase was in the severance taxes, largely a result of higher prices for natural resources. Most tax collections increased at rates below those of recent years because of (a) the energy shortage, (b) tax reductions or tax relief in several states or (c) the downturn in the economy.

In several instances, taxes grew somewhat slowly and unutilized potential failed to show expected growth because all states used the source less intensively. Average collections as measured by the proxy base declined.

Relative tax burdens among the states according to the measure in Table 19, Column 4, did not shift much. The five states with the heaviest burdens in 1973 remained the top five in 1974. Citizens of Alaska and the District of Columbia remained among the least burdened in 1974 and were joined by Connecticut, New Jersey and Ohio. Delaware, North Dakota and Nebraska increased their burdens.

The tax burden of the SREB states continued to be the least in relation to total personal income and that of the Middle Atlantic states was the greatest. The three regions with the highest burden reduced taxes from 1973 to 1974, while the three regions with the lowest burden increased average taxes as a percent of personal income. Thus, taxes nation-wide became more equal.

Discussion in this report has centered only on underutilization of a particular tax source without due consideration to overutilization of other sources. Tables 20 through 34 report both overutilization and underutilization by tax source and net over or underutilization for SREB states. Net over or underutilization is reported by state in Table 36, Column 2. In eight states net overutilization is indicated. In the New England states and the Pacific states net overutilization for the entire region is evident.

Collections listed in tables of this report are not affected by 1975 state or local actions and only partially by those taken in 1974. Major new tax actions--those significantly affecting collections--are reported in two sections preceding this summary. In an examination of a state's current position such new tax actions must be considered.

NOTES AND SOURCES FOR TABLES
 (Figures in columns and rows may not add to totals
 because of rounding and truncating)

TABLE 1

The average rate per \$1,000 of personal income for states using this tax is \$23.38.

Figures for the following states include local as well as state general sales tax collections: New York, Illinois, Kansas, Minnesota, Missouri, Nebraska, Ohio, South Dakota, Alabama, Arkansas, Georgia, Louisiana, North Carolina, Tennessee, Texas, Virginia, Arizona, Colorado, Nevada, New Mexico, Oklahoma, Utah, California and Washington. Alaska has a local general sales tax but no state tax.

SOURCE: Population, U.S. Bureau of the Census; Personal Income, Survey of Current Business, August 1975, Tables 1 and 2; State Collection data, U.S. Department of Commerce, Bureau of the Census, State Government Finances in 1974, Series GF74, No. 4, August 1975, Table 7; Local Collection data, U.S. Department of Commerce, Bureau of the Census, Government Finances in 1974, data furnished prior to publication; and estimates based on disaggregated local tax collection data furnished by the U.S. Department of Commerce Bureau of the Census.

TABLE 2

The average per \$1,000 of personal income for states using these taxes is as follows: for alcoholic beverages, \$2.09; for tobacco products, \$2.93; for insurance taxes, \$1.46; for public utility taxes, \$3.52; and for other selective sales taxes, \$1.14. Alcoholic beverage taxes include profits from state operated stores. Public utility taxes include profits from publicly owned utilities.

In Minnesota, North Carolina, and South Dakota net profits from municipal liquor stores are not included in alcoholic beverage tax computations. Profits from state liquor stores are included in the following states: Maine, New Hampshire, Vermont, Pennsylvania, Iowa, Michigan, Ohio, Alabama, Mississippi, Virginia, West Virginia, Idaho, Montana, Utah, Wyoming, Oregon and Washington.

SOURCE: See Citation for Table 1.

TABLE 3

The average rate per \$1,000 of personal income for states using this tax is \$1.25.

SOURCE: See Citation for Table 1.

TABLE 4

The average rate per \$1,000 of personal income is \$41.58.

No state property taxes were collected in Connecticut, Rhode Island, South Dakota, Tennessee, Oklahoma or Hawaii.

TABLE 5

The average rate per \$1,000 of personal income for states using these taxes is: for individual income taxes, \$20.84; and for corporate income taxes, \$5.67. Local business net income taxes are included in individual income taxes. In computing the average rate for individual income taxes, states not employing a broad based tax were excluded. These were Connecticut, New Hampshire, New Jersey and Tennessee.

Figures for the following states include local individual and business income taxes: Delaware, New Jersey, New York, Pennsylvania, Illinois, Michigan, Missouri, Ohio, Alabama, Kentucky, Maryland and Virginia.

SOURCE: See Citation for Table 1; and State Tax Collections in 1974, Series GF74, No. 1, Table 8.

TABLE 6

The average rate per \$1,000 of personal income for states using this tax is \$0.13.

SOURCE: See Citation for Table 1.

TABLE 7

The average rate per registered vehicle is \$28.72.

Figures include local motor vehicle and operators license taxes if collected.

SOURCE: See Citation for Table 1; and Automobile Facts and Figures (Detroit: Motor Vehicle Manufacturer's Association, 1975), p. 25.

TABLE 8

The average rate per registered vehicle is \$63.31.

Figures for the following states include local motor fuels taxes: New York, Alabama, Florida, Mississippi, Nevada and Hawaii.

SOURCE: See Citations for Tables 1 and 7.

TABLE 9

The average rate per \$1,000 of value for states using this tax is \$47.36.

SOURCE: See Citation for Table 1; and U.S. Department of the Interior, Minerals Yearbook, 1972, Volume I (Washington, D.C.: U.S. Government Printing Office, 1974), Table 4, p. 88; U.S. Department of Commerce, Current Fishery Statistics, No. 6100, Fisheries of the United States, 1972 (Washington, D.C.: U.S. Government Printing Office, March 1973), p. 22; and U.S. Bureau of the Census, Census of Agriculture, 1969, Volume II, General Report, Chapter 7, Value of Products, Economic Class, Contracts (Washington, D.C.: U.S. Government Printing Office, 1973), Table 3.

TABLE 10

The average rate per \$1,000 of personal income for states using this tax is \$.619.

New York and Texas were excluded in the computation of the average rate.

Local realty transfer tax in city of Wilmington, Delaware, is levied at a rate of one percent.

Local tax in New York City on transfers of real property where consideration is over \$25,000.

Local taxes are authorized in Pennsylvania. Over 1,000 school districts and 850 other units impose this tax.

Tax in Indiana is restricted to corporations subject to gross income tax.

A local tax is authorized in Ohio, South Carolina, West Virginia and California.

City of Baltimore, Maryland, and specified counties are authorized to levy this tax.

Virginia counties and cities levy a tax of one-third the state tax.

In Washington, a county tax is authorized and employed in all 39 counties on real estate at a one percent rate.
